FRONT-END DEVELOPMENT

ASSIGNMENT 1

Problem Statement

Simple Event Registration Page

Small events such as workshops, seminars, and college programs need a simple way to collect participant details. This project focuses on building a **front-end-only event registration page** using HTML, CSS, and JavaScript, without any backend or database.

Level-1: Basic Page Structure (HTML)

Objective

Create the basic structure of the Event Registration Page using HTML.

• Event Title and Description

- Display the name of the event using a heading.
- Add a short paragraph explaining the purpose of the event.

• Event Information Section

Include basic details about the event:

- Event Date
- Time
- Venue
- Organizer Name

(Use a list or table to present this information.)

• **Registration Form with the Following Fields**

Personal Details

- Name
- Email
- Phone Number
- Date of Birth
- Gender (Radio buttons)

Event Details

- Event Selection (Dropdown)
- Mode of Participation (Online / Offline – Checkboxes or Radio buttons)

Additional Information

- College / Company Name
- Upload ID Proof (File input)
- Comments / Expectations (Textarea)

• **Form Controls**

- Submit Button
- Reset Button (to clear the form)

• **Grouping of Form Fields**

- Use **fieldset and legend** to organize:
    - Personal Information
    - Event Selection
    - Additional Details

(This improves structure and readability even without styling.)

• Section to Display Registered Participants (Static for Now)

Create a placeholder table with headings:

Name	Email	Phone	Event	Mode

(Add one sample row as dummy data. This will be made dynamic in Level-2.)

• Declaration / Confirmation Checkbox

Add a simple checkbox:

"I confirm that the above details are correct."

• Footer Section

Include:

- Contact Email
- Help Desk Number
- Copyright text
