TITLE: Student Activity Tracker Web Application

1. Use Case and Assumptions

Students often need a simple way to track their daily learning activities and assignments. This application helps students view their activities and mark them as completed. It is assumed that the application runs in a web browser and uses static data or local storage

2. Problem Statement

Many beginner developers find it difficult to build complete applications because backend development is complex. Therefore, a simple front-end application is required to help students track their learning activities in an easy way

3.Objective

The main objective of this project is to design a simple student activity tracker using front-end technologies such as HTML, CSS, and JavaScript

4. Key Features

- *Display a list of student activities.*
- *Show activity name and description.*
- *Mark activities as completed*
- *Show progress summary*
- *Easy navigation between sections*

4.1 Home Page

The home page displays the title of the application and a welcome message for the user. It provides a simple introduction to the activity tracker

4.2 Activity List View

The Activity List View displays a list of student learning activities. Each activity includes the activity name, a short description, and the current status such as Pending or Completed. This section helps users easily view and track their tasks

- *Activity name*
 - *Short Description*
 - *Current Status (Pending / Completed))*
-

4.3 Mark Activity as Completed

Users can mark an activity as completed by clicking a button. The status will change from Pending to Completed

4.4 Progress Summary

The progress summary shows how many activities have been completed. For example, it displays “3 out of 6 activities completed”

4.5 Navigation

Navigation allows users to easily move between the home page and activity list section of the application.

5. UI and Usability Considerations

The application has a clean and simple interface with readable text and clear buttons. Proper spacing and responsive layout ensure the application works on both desktop and mobile devices.

6. Technology Used

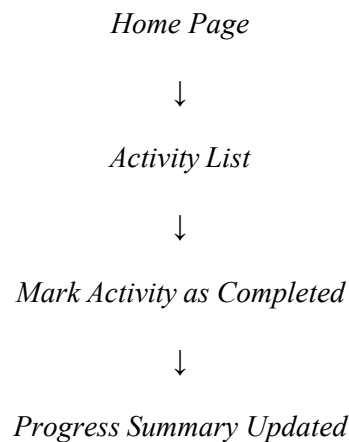

- HTML
 - CSS
 - JavaScript
-

7. Data Handling Method

Activity data will be stored using static data or a JSON file. JavaScript will manage activity status and update the progress summary.

8. High-Level UI Flow / Wireframe

User Flow:

9. Implementation Approach

The application will be developed using HTML for structure, CSS for styling, and JavaScript for functionality. Activities will be displayed on the page and users can update their status

10. Expected Outcome

The final result will be a simple web application that allows students to track their learning activities and monitor their progress easily.

11. Learning Outcome

(Through this project, students learn basic front-end development skills including UI design, CSS styling, JavaScript interactivity, and responsive web design)

12. Conclusion:

This project demonstrates how a simple front-end application can help students manage their activities and improve productivity without requiring backend development
