

FRONT-END DEVELOPMENT

ASSIGNMENT 3

Problem Statement

Simple Event Registration Page – Adding JavaScript Interactivity

In **Assignment-1**, you created the structure using HTML.

In **Assignment-2**, you enhanced the appearance using CSS.

In **Assignment-3**, you will make the page interactive using **JavaScript**, enabling validation and dynamic display of registered participants — still without using any backend or database.

Level-3: Interactivity Implementation (JavaScript)

Objective

Add client-side functionality to make the registration form responsive, validated, and capable of displaying user-entered data dynamically.

Requirements

1. Form Validation (Mandatory)

Validate the following fields when the user clicks **Submit**:

Field	Validation Rule
Name	Cannot be empty
Email	Must follow proper email format
Phone Number	Must contain exactly 10 digits
Date of Birth	Must be selected
Gender	Must be selected
Event Selection	Must choose an event
Mode of Participation	Must be selected

Field	Validation Rule
-------	-----------------

College/Company	Cannot be empty
-----------------	-----------------

Behavior:

- Show alert or inline message if validation fails.
 - Prevent form submission if any field is invalid.
-

2. Confirmation Checkbox Validation

- Ensure the user checks:
“I confirm that the above details are correct.”
 - If unchecked → display warning and stop submission.
-

3. Dynamic Display of Registered Participants

Instead of the static row from Assignment-1:

- Capture form data using JavaScript.
- Add the entered data dynamically into the participants table.
- Each submission should create a **new row**.

Displayed Columns:

- Name
 - Email
 - Phone
 - Event
 - Mode (Online/Offline)
-

4. Prevent Page Reload

Use JavaScript to:

- Prevent default form submission behavior.
 - Keep the user on the same page while updating the table dynamically.
-

5. Clear Form After Successful Submission

Once data is added to the table:

- Automatically reset the form fields.
 - Remove validation messages.
 - Keep the table data intact.
-

6. Display Success Message

After successful registration:

- Show a message such as:
 “Registration Successful!”
 - Message should disappear after a few seconds (use `setTimeout()`).
-

7. Add Basic Input Feedback (User Experience Enhancement)

Use JavaScript to:

- Highlight fields in red if invalid.
 - Highlight fields in green if valid.
 - Remove highlight when corrected.
-

8. Optional Enhancement (Bonus Task)

Students may implement:

- Count of total registered participants.
- Delete button to remove a row.
- Prevent duplicate email registrations.

- Display selected event summary before submission.
-

JavaScript Concepts to Be Used

Students must demonstrate understanding of:

- DOM Selection (getElementById, querySelector)
 - Event Handling (addEventListener)
 - Form Validation Techniques
 - Prevent Default Submission
 - Dynamic Element Creation (createElement, appendChild)
 - Working with Tables via JavaScript
 - Conditional Logic
 - String Handling & Basic Regex (for email validation)
 - setTimeout() for UI messages
-

Expected Outcome

By completing Assignment-3:

- The page becomes a **fully interactive front-end application**.
- Students understand how JavaScript controls behaviour without backend support.
- The project simulates a real-world registration interface using only client-side technologies.
