Level-1

Use Case: Building a Simple Student Activity Tracker Web Application

Scenario

Students enrolled in training programs or academic courses often need a simple and organized way to track their daily learning activities, assignments, and progress. Most existing productivity or learning tools are either too complex, require backend setup, or involve advanced configurations that are not suitable for beginners.

The goal is to build a lightweight, front-end-only web application that allows students to view activities, update their progress, and monitor completion status through a clean and user-friendly interface.

Problem Statement

Beginner developers frequently struggle to build complete applications due to the complexity of backend integration and data management. As a result, students lack simple tools that help them stay organized while also serving as practical learning projects.

The challenge is to **design and develop a simple front-end web application** that enables students to track learning activities and progress, focusing on **UI design, basic interactivity, and usability**, without relying on backend services.

Key Points to Consider

Core Components to Design

- Home page displaying application title and welcome message
- Activity list view showing:
 - Activity name
 - Short description
 - Current status (Pending / Completed)
- Simple navigation between pages or sections

Application Functionality to Support

- Display a predefined list of student activities (static or JSON-based)
- Allow users to mark activities as **Completed**

- Show a basic progress summary:
 - Example: “3 out of 6 activities completed”

UI and Usability Considerations

- Clean and minimal user interface
- Readable typography and consistent spacing
- Responsive design for mobile and desktop devices
- Easy-to-understand buttons and labels

Technology and Development Constraints

- Front-end technologies only:
 - HTML, CSS, JavaScript
 - Optional: React (basic components and state management)
- No backend or database integration required
- Local storage or static data may be used

Expected Output for Level-1: Ideation & Solution Documentation

Deliverables

- Explanation of the **use case and assumptions**
- Clearly defined **problem statement** highlighting the need for a simple activity tracker
- List of **key features and UI components**
- High-level **UI flow or wireframe** (hand-drawn or digital)
- Description of how activity status and progress will be tracked
- Short note on **usability and responsiveness considerations**
